CLAIMS

What is claimed is:

1. A magnetic torque transfer device comprising:

an input member;

at least one input gear rotatably driven by the input member, the at least one input gear including a first plurality of gear teeth;

an output member;

at least one output gear rotatably driven by the output member, the at least one output gear including a second plurality of gear teeth, the second plurality of gear teeth meshingly engaged with the first plurality of gear teeth; and

a magneto rheological fluid disposed between at least some of the meshing first and second pluralities of gear teeth;

wherein the input member is normally permitted to rotate relative to the output member and is coupled for rotation with the output member upon activation of the magneto rheological fluid.

- 2. The magnetic torque transfer device of claim 1, wherein the magnetor rheological fluid operates in a compression mode between the at least some of the meshing first and second pluralities of gear teeth upon activation.
- 3. The magnetic torque transfer device of claim 1, wherein the at least one input gear includes a plurality of pinion gears.
 - 4. The magnetic torque transfer device of claim 1, further comprising means for activating the magneto rheological fluid.
- 5. The magnetic torque transfer device of claim 1, wherein the means foractivating comprises at least one electrical coil.
 - 6. The magnetic torque transfer device of claim 1, wherein the device is a clutch:
 - 7. The magnetic torque transfer device of claim 1, wherein the device is a brake.
- 8. A torque transfer device comprising:

an input assembly;

an output assembly; and

a magneto rheological fluid disposed between the input assembly and the output assembly, the magneto rheological fluid operative in

WO 2005/114000 PCT/US2004/024992

a first state for permitting relative rotation between the input and output assemblies and a second state for coupling the input and output assemblies for common rotation, the MRF operating in a compression made in the second state.

- 5 9. The torque transfer device of claim 8, wherein the input assembly includes a first gear and the output assembly includes a second gear, the first gear meshingly engaged with the second gear.
 - 10. The torque transfer device of claim 9, wherein the MRF is disposed between the first and second gears.
- 10 11. The torque transfer device of claim 8, further comprising means for activating the MRF.
 - 12. The torque transfer device of claim 11, wherein the means for activating comprises at least one electrical coil.
 - 13. The torque transfer device of claim 8, wherein the device is a clutch.
 - 14. The torque transfer device of claim 8, wherein the device is a brake.

20

15. A method of transferring torque, the method comprising the steps of: providing a device having an input assembly coupled for relative rotation to an output assembly, the device having a magneto rheological fluid (MRF) disposed between the input and output assemblies; and

activating the MRF to couple the input shaft for common rotation with the output shaft in a compression mode.
